Tomorrow's workshop session

Citation Data

THE uses FWCI as part of its overall citation. This is calculated by the Elsevier Data Science team using raw citation data from Scopus. QS uses Scopus for the raw data that underpins its citation calculation, and to exclude self-citations. QS normalizes citations with a Normalize Total Citation Count (NTCC). Additionally, QS applies Scopus *h*-index data for their Subject Rankings.

International Collaboration

Again, for the WUR, this number is calculated by the Data Science team using Scopus data. It is the number of internationally co-authored by a university's faculty each year, a metric universities can also find and benchmark in SciVal.

Research Productivity

To generate its research productivity metric, THE uses the number of publications (peer-reviewed scholarly output) derived from Scopus data, divided by the number of staff (based on the university's own internal staffing data)

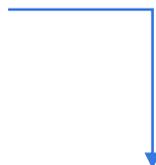

Reputation survey results and analysis

Elsevier facilitates the reputation survey for THE by randomly selecting the recipients from among the universe of researchers available through Scopus author and affiliation profiles. Elsevier conducts the survey on behalf of and delivers the results to THE.

What we do step by step on tomorrow workshop?

Visualize research performance

Develop collaborative partnerships

Benchmark your progress

Analyze research trends

Perform complete portfolio analysis

Thank you
